17 Glossary of SEO terms

1. SEO Studio in one page

SEO Studio is CreativHeads' own SEO and AEO (AI search) workspace. For every client it collects real data from Google and other tools, finds problems and opportunities, writes fixes and content with AI, sends everything for approval, and then applies approved changes to the client's WordPress website. At the end of the month it produces a client-ready report as a PDF.

What it replaces

Separate spreadsheets for keywords, manual site audits, copy-pasting titles into WordPress, chasing approvals over chat, and building monthly reports by hand.

What makes it safe

Nothing changes on a website without approval. Every change saves the old value so it can be rolled back. Paid services have budgets. Each user only sees the sections the Admin allows.

SEO (Google)

Keywords and rankings, technical site health, page speed, titles and meta descriptions, schema, content plans and refreshes.

AEO (AI answer engines)

Checks whether ChatGPT, Gemini and Perplexity mention the brand and cite its website when people ask important questions, and suggests what to publish to win those answers.

The 13 screens

Sidebar name	Purpose in one line
Dashboard	One client's health: traffic, rankings, issues, approvals waiting, AI visibility.
All Clients	Portfolio view of every client with health, traffic trend and items waiting.
Keywords	Tracked keywords, positions, Search Console imports, live keyword ideas.
Site Audit	Technical problems from quick audit, full crawl and PageSpeed.
Fixes	Proposed changes (many written by AI), approval queue, apply and roll back.
Dev Tickets	Problems that need a developer (server errors, redirects, speed).
Content	Briefs and AI drafts with quality checks, sent to WordPress as drafts.
Content Plan	Monthly editorial plan and pages that need refreshing.
AI Visibility	Questions checked in ChatGPT, Gemini and Perplexity.
Schema	Structured data (JSON-LD) builder and validator.
Reports	Monthly report, AI assistant on saved data, PDF download.
Admin Admin only	Approvals inbox, user access and limits, usage, activity.
Settings Admin only	API keys and connections (Google, DataForSEO, OpenAI, PageSpeed, Brandroom).

Client Setup (each client's website, Google properties, WordPress and Knowledgebase link) opens from the client's Dashboard.

2. How it works (the flow)

1 · Collect Search Console, Analytics, PageSpeed, DataForSEO crawl and keywords, AI engines, Brandroom. →

2 · Find Issues, keyword opportunities, pages losing traffic, unanswered AI questions. →

3 · Propose Fixes and drafts written by AI using the client's brand voice. →

4 · Approve SEO Lead reviews, Admin or Head approves. →

5 · Apply Written to WordPress. Old value saved for rollback. →

6 · Report Monthly report and PDF for the client.

Where each piece of data comes from

Data	Source	How it gets in
Clicks, impressions, positions, search queries	Google Search Console	"Sync Google" (automatic when you open a client, or one click). Last 56 days.
Sessions, engaged sessions	Google Analytics 4	Same sync, last 56 days.
Tracked keywords with positions	Search Console	"Import keywords from Search Console" (last 28 days, no duplicates).
New keyword ideas and search volume	DataForSEO	"Live keyword research" in Keywords.
Technical issues (27 checks)	DataForSEO crawler + quick audit	"Run full site crawl", then "Check crawl" after 10–20 minutes.
Speed score, LCP, CLS	Google PageSpeed	"Run PageSpeed check" in Site Audit.
Brand mentioned / website cited in AI	DataForSEO AI engines	"Check" on each question in AI Visibility, or "Run all".
Current page titles, metas, alt text	WordPress (connector plugin)	Read when AI proposes fixes, and before every apply.
Brand voice, facts, approved examples	Brandroom Knowledgebase	Automatic for every AI draft and AI fix.

Important rules built into the system

- **Read-only by default.** Syncing, auditing, crawling and AI checks never change the website.
- **Only three actions change a website:** Apply fix, Roll back fix, and Send content to WordPress (always as a draft, never published).
- **Safety check before apply:** the server re-reads the current value on the website and stops if someone changed it since the fix was written.
- **Every action is logged** with who did it and when (Admin → Activity).
- **Every task shows before it runs:** what it does, how long it takes, and whether it is Free or Paid.

3. What is working today

Checked on 10 October 2026: all 13 screens open with real data and no errors for both the Admin and the SEO Lead. 22 of 22 automated tests pass. Moving between sections takes about 0.1–0.3 seconds without reloading the page.

Connection	Status	Notes
Google Search Console	Working	Connected by Google sign-in (OAuth) with the account that has access to the clients. Every property that account can see is available.
Google Analytics 4	Working	Same Google sign-in. Read-only.
Google PageSpeed Insights	Working	Free.
DataForSEO	Working	Keyword research, ranking checks, full crawls and AI engine checks. Paid per use.
Brandroom Knowledgebase	Working	All Brandroom brands can be imported as clients. White Stone is linked (35 brand fields, 7 examples). Brandroom must be running on this PC (see section 15).
WordPress (White Stone)	Partly	Login saved. The **ch-seo-connector** plugin must be installed on whitestonealigners.com before fixes can be read or applied.
OpenAI (AI writing)	Not yet	The key saved now is a placeholder, not a real key. **AI drafts, "Fix all with AI" and the Reports AI assistant will not run** until a real OpenAI API key is added in Settings.
Team login (Microsoft/Teams)	Local mode	On this PC users switch with the developer password. Company sign-in is used when hosted online.
Automatic schedule	Manual	Tasks run when someone clicks them (Google sync also runs when a client is opened). A timed scheduler is used only when hosted online.

Clients and team today

- Clients: **White Stone** (whitestonealigners.com, WordPress). More can be added from Brandroom with "Import from Knowledgebase".
- Team: 1 Admin, 1 SEO Lead (Sinan). Roles for Head and Staff are available when needed.

Spending so far (real numbers from the usage log)

Task	Runs	Total cost
Keyword research (DataForSEO)	1	$0.09
Full site crawl (DataForSEO)	3	$0.045
Crawl status checks	4	$0.00
AI visibility check (DataForSEO)	1 succeeded, 2 failed (not charged)	$0.028
Total		**≈ $0.16**

4. Starting SEO Studio and logging in

Start

1. Double-click `START_SEO_STUDIO.bat` in `D:\CH SEO Agentic` (or run `npm run dev` in that folder). Node.js 22.5 or newer is needed.
2. Wait for “SEO Studio is ready: http://127.0.0.1:8000”. Keep that window open.
3. Open **http://127.0.0.1:8000** in the browser.
4. For the Knowledgebase, Brandroom must also run: open its folder and run `npm run dev` (it uses http://localhost:3100).

Log in / switch user (this PC)

Choose the person (Admin or SEO Lead) and type the **Developer Password**. That password is stored only in the file `D:\CH SEO Agentic\.env` on the line `DEV_PASSWORD=`. Open the file in Notepad to see or change it (at least 10 characters). The old password `admin123` no longer works.

> **Keep the password private**
> Do not paste it into chat, screenshots or emails. Anyone with it can switch to the Admin account on this PC.

Stop

Press **Ctrl + C** in the SEO Studio window, or close it. Data is kept in `.local\studio.sqlite`.

5. Team roles: who can do what

Action	Admin	Head	SEO Lead	Staff
See clients and data	✓	✓	✓	✓ (view)
Create / edit keywords, issues, fixes, content, plans, schema	✓	—	✓	—
Run tasks (sync, audit, crawl, research, AI checks)	✓	—	✓ (within limits)	—
Send items for review	✓	—	✓	—
Approve or reject fixes and content	✓	✓	—	—
Approve the monthly report	✓	—	—	—
Apply approved fixes to the website	✓	✓	—	—
Send approved content to WordPress (as draft)	✓	✓	—	—
Roll back an applied fix	✓	✓	✓	—
Admin dashboard, user access, limits	✓	—	—	—
Settings: API keys and connections	✓	—	—	—

On top of the role, the Admin can set each section to **None** (hidden), **View** or **Edit** for each person, and set monthly limits on paid tasks. These rules are enforced by the server, not only hidden in the screen: we tested that the SEO Lead gets “not allowed” for admin pages, API keys and access changes.

Admin sees

13 sidebar items including Admin and Settings, all clients, all costs, approvals inbox, every user's activity.

SEO Lead sees

11 sidebar items (no Admin, no Settings). Opening the Admin address directly shows nothing. Only sections the Admin allows.

6. The SEO Lead: what to do after login

Every day (10–15 minutes)

1. **Open the Dashboard** for each client. Google data syncs automatically. Look at clicks/impressions trend, issues and "waiting for approval".
2. **Fixes**: check any fixes that were rejected or sent back, correct them and send them for review again. If a fix that was applied causes a problem, the SEO Lead can **Roll back** it.
3. **Site Audit**: if a crawl was started, click "Check crawl" to load results.

Every week

1. **Keywords → Import from Search Console.** Updates positions; look at "striking distance" (positions 4–20) — the quickest wins.
2. **Site Audit → Run quick audit** (free) and **Run PageSpeed check** (free).
3. **Fixes → Fix all with AI** on title, meta description and alt-text issues. Review each proposal, edit if needed, then **Send for review**.
4. **Dev Tickets**: send developer problems (server errors, redirects, speed) to the developer and update status.
5. **Content**: write or generate drafts for planned topics; fix any quality warnings; send for review. After approval, the Admin sends it to WordPress as a draft.

Every month

1. **Site Audit → Run full site crawl** (paid, small). Check it 10–20 minutes later.
2. **AI Visibility → Run all** questions. Use "Suggest" to get content ideas for questions where the brand is missing.
3. **Keywords → Live keyword research** on 2–3 main topics to find new ideas (paid, small).
4. **Content Plan**: build next month's plan and pick pages to refresh (pages losing clicks).
5. **Reports**: create the monthly report, click Refresh to load the latest data, add notes, send for review. The Admin approves, then download the PDF for the client.

> **Golden rule**
> The SEO Lead prepares and sends for review; the Admin (or Head) approves. Nothing reaches the client website or the client report without approval.

7. Every section explained

Section	What you see	What you can do
Dashboard	Clicks, impressions, CTR and position with change vs previous period; daily trend; sessions; top pages up and down; issues by severity; approvals waiting; AI visibility score; next steps.	Sync Google now, jump to any section, open Client Setup.
All Clients	Every client with health score, traffic trend, open issues, items in review, connections status.	Open a client, add a client, import clients from Knowledgebase.
Client Setup	Website, Search Console property, GA4 property, WordPress login, Knowledgebase brand, location/language, brand words, crawl page limit, monthly budget, "apply on approve".	Connect / test each connection, link a Brandroom brand, set budget.
Keywords	Tracked keywords with position now and before, clicks, impressions, ranking page, intent, search volume; striking-distance list; cannibalisation (two pages fighting for one query); keyword ideas.	Import from Search Console (free), live keyword research (paid), check ranking (paid), add/track a keyword, filter and search.
Site Audit	Health score, issues by severity and type, PageSpeed score with LCP and CLS, crawl history, each issue marked new / worse / better / fixed.	Quick audit (free), PageSpeed (free), full crawl (paid), check crawl, create fix or dev ticket from an issue.
Fixes	Every proposed change: page, current value, new value, why, status (draft, in review, approved, applied, rolled back).	Fix all with AI, edit, send for review, approve/reject (Admin/Head), apply, roll back, bulk actions, turn on automatic apply.
Dev Tickets	Problems that need a developer with steps to fix, priority and status.	Create, assign, update status, copy the developer brief.
Content	Briefs and drafts with a quality check: readability, keyword use, headings, length, brand-voice check.	Generate AI draft (uses Brandroom), edit, send for review, send to WordPress as a draft.
Content Plan	Monthly editorial calendar and refresh list (pages losing traffic).	Add plan items, turn them into content, mark refreshes done.
AI Visibility	Questions customers ask, and for each AI engine whether the brand is mentioned and the website cited; overall visibility score.	Check one question or Run all (paid), Suggest content for a question, add questions.
Schema	Structured data blocks (Organization, LocalBusiness, FAQ, Article, Product, etc.) with validation.	Generate, validate, copy JSON-LD, send for review.
Reports	Full monthly report: summary, search performance, traffic, keywords, technical health, AI visibility, work done, priorities.	Create, refresh data, add notes, ask the AI assistant about saved data, approve (Admin), download PDF.

The 27 checks in a full crawl

Critical: server errors (5xx), broken pages. **High:** pages not found (4xx), pages with broken links, canonical to a broken page, missing page title, duplicate content, slow loading pages. **Medium:** canonical to a redirect, redirect chains, orphan pages, duplicate titles, missing meta descriptions, missing H1, images without alt text, thin content, render-blocking scripts, no text compression,

large page size, slow server response. **Low:** links to redirects, redirected URLs, titles too long / too short, duplicate meta descriptions, duplicate meta tags, low text-to-code ratio.

The quick audit (free) checks the homepage for title, meta description, H1, canonical, schema, image alt text and mobile viewport.

8. Approvals and automatic fixing

Issue found by audit or crawl → **Fix all with AI** reads current value from WordPress, writes a better one per page → **SEO Lead reviews** edits if needed, Send for review → **Admin / Head** Approve or Reject (with reason) → **Apply** automatic, or Admin clicks Apply; old value saved → **Re-check** next audit marks the issue fixed

What can be fixed automatically

Issue type	Fixed automatically?	How
Missing / too long / too short / duplicate page titles	Yes	AI writes a new title per page; applied through WordPress (SEO plugin field).
Missing / duplicate meta descriptions	Yes	AI writes per page; applied through WordPress.
Images without alt text	Yes	AI writes alt text; applied to the image in WordPress.
Schema	With review	Generated and validated in Schema; after approval the JSON-LD is added to the page.
Server errors, broken pages, redirects, speed, compression	No	Become Dev Tickets with clear steps for a developer.
Thin / duplicate content	With content work	Handled in Content / Content Plan.

Automatic apply (“apply on approve”)

In Fixes (or Client Setup), turn on **Apply automatically when approved**. Then, the moment the Admin approves a fix, SEO Studio writes it to the website — no extra click. If it is off, the Admin (or Head) clicks **Apply** after approval. Today it is **off** for White Stone.

> **Safety**
> Before writing, the server reads the live value again. If someone changed it in WordPress after the fix was written, the apply stops and asks for a new review. Every applied fix can be **rolled back** to the saved old value.

> **Needed for automatic fixing**
> (1) The ch-seo-connector plugin installed on the client's WordPress site, and (2) a real OpenAI API key in Settings. Without these, “Fix all with AI” and Apply will show a clear “connection required” message and nothing is sent.

9. Admin features

The Admin dashboard (sidebar → Admin) is only for Admins. Each panel has a short explanation on screen.

Approvals inbox

Every fix, content draft, schema and report waiting for approval, across all clients, with who sent it and when. Approve or reject (with a reason) straight from the list. The sidebar shows the number waiting.

Team access

For each team member, each of 8 sections — Keywords, Site Audit, Fixes, Dev Tickets, Content & Plan, AI Visibility, Schema, Reports — can be **None** (hidden and blocked), **View** (read only) or **Edit**. Admins always have full access.

Monthly usage limits

Per person, per month: AI article drafts, AI fix runs, keyword research searches, AI visibility checks, full site crawls. 0 = no limit. When reached, the person sees "Monthly limit reached … ask an Admin". Counts reset on the 1st (India time).

Usage & costs

How much each paid service has used this month per client, against the monthly caps. Failed calls are not counted.

Activity

Who did what and when: approvals, applies, rollbacks, settings changes, tasks run.

Settings (connections)

Save and test API keys for Google, PageSpeed, DataForSEO, OpenAI and Brandroom. Keys are stored encrypted and are never shown again after saving.

Admin routine

- **Daily:** clear the Approvals inbox (aim: nothing older than 1 working day).
- **Weekly:** look at Usage & costs and Activity.
- **Monthly:** approve each client's report; review team access and limits; add new clients from Brandroom.

10. AI models, paid services and prices

Service	Used for	Model / product	Price
Google Search Console	Clicks, impressions, positions, queries	Search Console API	Free
Google Analytics 4	Sessions, engagement	GA4 Data API	Free
Google PageSpeed	Speed score, LCP, CLS	PageSpeed Insights API (mobile)	Free
WordPress	Read and apply fixes, send drafts	ch-seo-connector plugin	Free
Brandroom	Brand voice and facts for AI	Brandroom Knowledge API (own)	Free
DataForSEO	Live keyword research	Keywords Data / Labs	≈ $0.09 per search (measured)
DataForSEO	Ranking check	Google SERP	Fraction of a cent per keyword
DataForSEO	Full site crawl	On-Page crawler	≈ $0.015 per crawl start (measured, depends on page limit); status checks ≈ free
DataForSEO → ChatGPT	AI visibility check	**gpt-5.4-mini** (with web search)	≈ $0.03 per question per engine (measured $0.028). Checking all White Stone questions in 3 engines ≈ $1–1.50.
DataForSEO → Gemini	AI visibility check	**gemini-2.5-flash**	
DataForSEO → Perplexity	AI visibility check	**sonar**	
OpenAI	AI drafts, Fix all with AI, Reports assistant, AEO suggestions	**gpt-4** (current setting)	Rates set in the app: $10 per 1M input tokens, $30 per 1M output tokens. A title/meta fix run is a few cents; a full article draft roughly $0.10–0.30.

> **Recommendation for OpenAI**
> gpt-4 is an older and expensive model. When adding the real OpenAI key in Settings, choose a current, cheaper model available in your OpenAI account (for example a "mini" model) and enter its input/output price per million tokens from OpenAI's pricing page, so cost estimates and budgets stay correct. ChatGPT Plus/Team subscriptions do **not** include API usage — the API is billed separately at platform.openai.com.

Measured prices come from SEO Studio's own usage log. Provider prices can change; the usage log always shows the real amount charged.

Typical monthly cost per client (estimate)

Work	Per month	Approx. cost
Weekly Google sync, imports, quick audit, PageSpeed	Unlimited	$0

Full crawl	1–2	< $0.10
Keyword research	3–5 searches	$0.30–0.50
AI visibility (all questions, 3 engines)	1 run	$1–1.50
AI fixes + 4 article drafts (with a cheaper model)	—	$0.50–2
Total		**≈ $2–5 per client**

11. Budgets and spending safety

Before any paid request, SEO Studio **reserves** a maximum amount. If that would go over a budget, the request is **not sent** and you see “Monthly provider or client budget reached. No paid request was sent.” After the call, the reservation is replaced with the real cost. Failed calls release their reservation.

Limit	Current value	Where to change
Monthly cap — DataForSEO (all clients)	$30	Settings → API Keys & Connections
Monthly cap — OpenAI (all clients)	$15	Settings → API Keys & Connections
Monthly cap — per client (all providers)	$30 (default)	Client Setup → monthly budget
Max reserved per keyword research / ranking / AI check / crawl request	$10 each	`.env` DATAFORSEO_*_MAX_USD
Max reserved per crawl status check	$1	`.env` DATAFORSEO_POLL_MAX_USD
Max reserved per AI draft or AI fix run	$5	Settings → OpenAI
Max reserved per Reports assistant answer	$2	Settings → OpenAI
Per-person monthly task limits	Off (0)	Admin → Team access

> **Tip**
> The “max reserved” values are a safety ceiling while a request runs, not the real price. Because real calls cost cents, you can lower the $10 values to $1 so that several tasks can run at the same time without touching the monthly cap.

12. Knowledgebase (Brandroom)

Brandroom is CreativHeads' brand knowledge system. SEO Studio reads it (read-only) so all AI writing sounds like the client.

- **Import clients:** All Clients → *Import from Knowledgebase* lists every Brandroom brand. Tick the ones to add; each is created with its name, website, location and brand words, and linked to its brand.
- **Link a brand:** Client Setup → Knowledgebase tab → *Link a brand* (or leave on "match automatically by website").
- **What is shown:** brand facts, brand guidance (tone, do/don't), approved and rejected writing examples, shared documents.
- **What it is used for:** every AI draft and every "Fix all with AI" receives the brand's writing context for the *Website* platform.
- **Privacy:** internal fields, notes and team-only documents are never sent to SEO Studio. Edit brand knowledge only in Brandroom.

> **Brandroom must be running**
> On this PC Brandroom runs at http://localhost:3100. After restarting the computer, start it again with `npm run dev` in the Brandroom folder; otherwise the Knowledgebase tab shows a connection error (nothing else breaks).

13. Reports and PDF

Reports → *New report* builds a monthly report from saved data; *Refresh* reloads the latest numbers.

Part	Content
Cover & summary	Client, month, headline numbers and plain-language summary.
1 · Search performance	Clicks, impressions, CTR, position vs previous period; daily trend; pages up and down.
2 · Website traffic	GA4 sessions and engaged sessions.
3 · Keywords	Movers, striking-distance opportunities, cannibalisation.
4 · Technical health	Health score, open issues, PageSpeed.
5 · AI visibility	Mention and citation rate per engine.
6 · Work done & next priorities	Fixes applied, content published, tickets closed, plan for next month; sign-off box.

Until the Admin approves it, the PDF carries a **DRAFT** watermark. After approval, download the clean PDF for the client.

14. Security

Protection	What it means
Encrypted API keys	All keys and passwords for Google, DataForSEO, OpenAI, PageSpeed, WordPress and Brandroom are stored encrypted. After saving, they are never shown again.
Server-side permissions	Roles, section access and limits are checked on the server for every request. Tested: SEO Lead blocked from admin overview, keys, saving connections and changing access.
Signed login	The login cookie is signed; a fake or edited cookie is rejected.
Developer password	Moved out of the code into `.env` (DEV_PASSWORD), strong and compared safely. Old `admin123` removed.
Same-origin protection	Changes are only accepted from SEO Studio's own page.
Approvals and rollback	No website change without approval; every change can be undone; live value re-checked before writing.
Google read-only	Google access is read-only; SEO Studio cannot change Search Console or Analytics.
Spending caps	Paid calls stop at monthly provider and client budgets.
.gitignore	Keeps secrets and private data out of any code repository: `.env`, keys and certificates, Google credential files, the local database (`.local/` , `*.sqlite`), `node_modules` , build output, logs, backups and editor folders.
Clean-up	13 old one-off scripts and the demo seed file were moved out to `D:\SEO-Studio-removed-files` (can be deleted).

> **Please remember**
> Never share screenshots that show `.env` files, Brandroom's database password, Supabase service key, or any API key. If one was shared, create a new key at the provider and save it again in Settings.

15. What is left to finish

#	Task	Why	Who
1	**Add a real OpenAI API key** in Settings → OpenAI, choose a current model and its prices	Needed for AI drafts, Fix all with AI, Reports assistant and AEO suggestions.	Admin
2	**Install the ch-seo-connector plugin** on whitestonealigners.com (download from Client Setup), then Test connection	Needed to read and apply fixes and send drafts to WordPress.	Admin / developer
3	Start Brandroom after each restart (`npm run dev`)	Knowledgebase tab and brand voice for AI.	Anyone
4	Run AI Visibility → Run all for White Stone	First AI visibility baseline (≈ $1–1.50).	SEO Lead
5	Import the other clients from Brandroom and fill their Client Setup	Bring all clients into SEO Studio.	Admin / SEO Lead
6	Optional: lower the $10 per-request reservations to $1	Lets more tasks run together (section 11).	Admin
7	Optional: host online (Cloudflare) for team sign-in and the automatic schedule	Use from any computer; nightly syncs and audits.	Admin

16. Troubleshooting

You see	Do this
Dashboard shows no Google data	Click Sync Google. Check Client Setup has the right Search Console and GA4 property. In Settings check "Google account sign-in" is connected.
"Connection required"	The service for that task is not set up. Admin opens Settings → API Keys & Connections.
"Monthly … budget reached"	Nothing was charged. Admin raises the cap or waits for next month.
"Monthly limit reached"	Your personal limit for that task. Ask the Admin.
"You do not have … access"	The Admin has set that section to None/View for you.
Crawl stays "crawling"	Normal for 10–20 minutes. Click Check crawl later.
Knowledgebase error	Start Brandroom (`npm run dev`) and click Refresh.
Apply stopped: "value changed"	Someone edited WordPress. Review the fix again and re-approve.
Page does not open at 127.0.0.1:8000	Start SEO Studio (START_SEO_STUDIO.bat). If "port in use", close the other SEO Studio window.
Forgot the Developer Password	Open `D:\CH SEO Agentic\.env` in Notepad, line DEV_PASSWORD.

17. Glossary of SEO terms

Term	Meaning
SEO	Search Engine Optimisation — improving a website so it ranks higher in Google.
AEO	Answer Engine Optimisation — getting the brand mentioned and cited by AI assistants (ChatGPT, Gemini, Perplexity).
Impressions	How many times the site appeared in Google results.
Clicks / CTR	Visits from Google / clicks divided by impressions.
Position	Average ranking in Google (1 = top).
Striking distance	Keywords at positions 4–20 — small improvements bring big gains.
Cannibalisation	Two pages of the same site competing for one search, weakening both.
Search intent	What the searcher wants: information, comparison, buying, or a specific site.
Title / meta description	The blue headline and the grey text shown in Google results.
H1	The main heading on a page.
Alt text	Text description of an image for Google and screen readers.
Canonical	A tag telling Google which URL is the main version of a page.
Redirect (301) / chain	Sending one URL to another / several redirects in a row.
4xx / 5xx	Page not found / server error.
Orphan page	A page with no internal links pointing to it.
Thin content	A page with very little useful text.
Schema / JSON-LD	Structured data that tells Google and AI what a page is about (business, FAQ, article…).
LCP / CLS	Core Web Vitals: how fast the main content loads / how much the layout jumps.
GA4 session	One visit to the website; "engaged" means the visitor actually interacted.
Crawl	A robot visiting every page of the site to find technical problems.
Citation (AEO)	The AI answer links to the client's website as a source.
